2 3/8 Inch Tyrannosaurus rex Serrated Tooth Necklace Pendant

Like many carnivores dinosaurs T-rex often broke or shed its teeth while feeding. Over time a new tooth would grow from the old tooth socket. Thus T-rex had a variety of sizes of teeth, from only 1 inch above the gum line to 11 inches including the root. T-rex was up to 18.5 feet tall, 50 feet long, & weighed up to 6 tons. They were the dominant predator of the Cretaceous Age which ended about 65 ...Call for more details

Allognathosuchus, alligator crocodylian eggs

Allognathosuchus is an extinct genus of alligatorine crocodylian with a complicated taxonomic history. It was a medium-sized predator up to 1.5 m in length. This small alligatorine is known for its stout jaws and bulbous teeth, found near the rear of the tooth row in upper and lower jaws. These adaptations have historically been interpreted as having been for crushing mollusks. Isolated bulbous te...Call for more details

Archaeopteryx lithographica, Eichstatt Specimen B side

Side B. See item 1397 for Side A or item 1399 for both Side A&B Found near

Workerszell in 1951, it was described by P. Wellnhofer in 1974. This is the smallest of all the specimens, being some 2/3 the size of the others. It also differs in other aspects such as the tooth structure and the poorly ossified shoulder bones. It has been suggested that this is a separate genus, however th...Call for more details

Archiocidaris brownwoodensis, sea urchin

The Archiocidaris brownwoodensis sea urchins from the Brownwood Lake Spillway site were marine animals which died with their spines still attached.

This is a rare occurrence. The mud, or current matrix, around these sea urchins was not disturbed after they died, leaving them nearly complete.

Because of their nearly perfect condition it is assumed that their death was not caused by force, but from ...Call for more details

Carcharodon carcharias (Great White Shark) Tooth Pendant Rep...

Just look at the serrations on this tooth. The great white shark (*Carcharodon carcharias*), is the largest living species of large lamniform shark. They are found in the coastal surface waters of all the major oceans. The great white shark is mainly known for its size, with mature individuals growing up to 6.4 m (21 feet) in length and 3,324 kg (7,328 pounds) in weight. The great whi...Call for more details

Daspletosaurus, 3 Authentic Dinosaur Teeth

This series of 3 associated Daspletosaurus torosus teeth were found in Glacier County, Montana in October 2006. Each tooth is broken at top and bottom. Serrations are present on the front and back of each tooth. The enamel quality varies, but is generally fair, with significant root incursion on each tooth. The largest tooth is 2.17 inches. The middle tooth is 1.41 inches. The smallest tooth is 1....Call for more details

Laetoli, Australopithecus afarensis (early human footprints/...

This is a portion of a trail of footprints probably left by 2 Australopithecus afarensis individuals some 3.5 million years ago, at Laetoli, northern Tanzania. Australopithecus afarensis is an extinct hominid which lived between 3.9 and 2.9 million years ago. In common with the younger Australopithecus africanus, A. afarensis was slenderly built. From analysis it has been thought that A. afarensis...Call for more details

Manchurochelys liaoxiensis, also known as Ordosemys liaoxiensis, is described as a cryptodire (a turtle order), with a very low domed shell. The carapace, shell, had an oval outline, with the length being slightly longer than the width. Manchurochelys liaoxiensis looked like a modern turtle, but it was a primitive turtle and could not draw its head or legs into its shell. It likely fed on plants, ...Call for more details

Perchoerus, peccary skull

Perchoerus is one of the rarest of the mammal fossils found in the White River Badlands and is much rarer than the cats and nimravids from the same area. They bear a strong resemblance to pigs, but pigs are from a separate family (the Suidae). They are the result of convergent evolution to pigs. During the convergent evolution, they occupied similar ecological niches and both were omnivorous roote...Call for more details

Sleeping Muttaborrasaurus Dinosaur Model

[CLICK TO ENLARGE PHOTO](#) Muttaborrasaurus was a genus of herbivorous ornithomimid dinosaur, which lived in what is now northeastern Australia sometime between 107 and 103 million years ago during the early Cretaceous Period. It has been recovered in some analyses as a member of the iguanodontian family Rhabdodontidae. After Kunbarrasaurus, it is Australia's most completely known dinosaur...Call for more details

Triceratops, nose horn

Like antlers and horns on modern day mammals, Triceratops horns were probably used more for show (and thus mate selection) than for defense. But if you would rather forget we said that and instead reminisce on the more romantic "T. rex versus Triceratops" concept, we'll understand. And its important to remember that much speculation goes into recreating the life of dinosaurs so Triceratops may hav...Call for more details

Trilobite Composite Plate, 7 Species

Trilobites were a highly diverse group of organisms that inhabited shallow sea floors and reefs during the Paleozoic Era. They belong to an extinct class of the phylum Arthropoda. The phylum name comes from the Greek words: arthron-meaning jointed and podos-meaning foot. Trilobite means three-lobed and refers to the three lobes which run down the length of the trilobite's body. The trilobite's bod...Call for more details

Tyrannosaurus rex, right hand

This is a replica of the right hand of Tyrannosaurus rex. When Tyrannosaurus rex was first discovered, the humerus was the only element of the forelimb known. For the initial mounted skeleton as seen by the public in 1915, Osborn substituted longer, three-fingered forelimbs like those of Allosaurus. However, a year earlier, Lawrence Lambe described the short, two-fingered forelimbs ...Call for more details
